Secure Chat System v1.0

Ever needed that touch of security that is easily accessible?

You now have it.

All you have to do, is open up the program and receive your ID.

Exchange ID's with your partner, and hit "Connect", the connection would have been made.

Talk Away. :)

-All Messages are encrypted within the connection of Rijndael AES

-Soon to be hosted by a full-time server, no IP grabbing.

-Fully secure TCP connection.

-SOON to require a password.

Download: <http://www.mediafire.com/download/3o5fkp3wf1dkmgz/SCS.zip>

Virus Total:

Thanks for checking it out.

Lots of updates to be done over the course of 2 weeks.

NoodleBot™ - September 6, 2015, 9:35 pm

Would be nice to know more about encryption methods and how it's safe or safer compared to other tools and programs?

Updated,

Sorry I am on my phone and doing my best currently.

More features of course including more advanced cryptography implemented.

I also have lots of concerns about whether this would be actually safe or not.

I probably feel this way because you call your ID's "Hashes", which makes me wonder if you even understand security.

Oh and if you call it secure, at least post the details about your security instead of just mentioning AES.

Ex: <https://github.com/irungentoo/toxcore/blob/master/docs/updates/Crypto.md>

Good luck with this project. I've been wanting to make a chat client myself for a while.

No, I'm 100% sure this is the correct section to post this. :P

Doesn't tcp connection show IP? To make it secure it would need to be hosted on server and no logs kept there.

(of course vpn would make it a little more secure)

The idea sounds pretty great though.
