Thread: [Proxychains 4.10 won't work !](#)

AcKel - September 11, 2015, 1:21 am

Greetings,

I've been trying to use proxychains on kalilinux 2.0 for 3 days now, I just can't use it. Every time I try to run an application with it, I got an error, the application opens, but proxychains does not work, this means my ip does not change.

I've also tried to --traceroute to see if the traffic was actually going through the proxies but it isn't. I've already tried to use many different proxies, and all kind of chains as well (dynamic/strict/random/robin)

I looked up on the internet for solutions. I found people with the same problem, but with no big solutions, at least for me. That's why I decided to write this post :p
I'm using proxychains 4-10, and I'm aware proxychains 3.1 isn't running on kali anymore.
I've attached my proxychains.conf file (I only have two proxies on the pic, but as I said I've tried with more proxies and different ones too)
and there's also a pic of the error I got every single time.

Thank you guys in advance, I hope not to make you waste your time and to find a solution with you !
