Thread: [Computer won't boot up at all](#)

Nozemi™ - September 15, 2015, 4:24 am

So I have this computer that doesn't boot at all. Only getting errors while trying to boot (0xc000225). I then tried to boot up with a Windows installation media, but still says the same. Tried multiple installation medias, both USB and CD/DVD. Also multiple Windows versions.

Anyone have any idea how I could solve that? Any help with this would be greatly appreciated!

What Is Your PC Software? Windows (Possibly 7)?

If So I found something relating to this guide if you want to check it out:

Quote Note Tip:

Spoiler [\(Click to View\)](#)Quote:Windows 7 32bit

Windows 7 64bit

You should use an application such as ImgBurn to burn the ISO to a CD - a guide on using ImgBurn to write an ISO to a disc is [Here](#). Once created, or if you already have this, insert the CD into the notebook and restart to boot from it. Select Repair Your Computer and choose the Command Prompt. When this loads, enter the following commands and hit enter after each one - include spaces as shown.

```
Bootrec.exe
bcdedit /export C:\BCD_Backup
c:
cd boot
attrib bcd -s -h -r
ren c:\boot\bcd bcd.old
bootrec /RebuildBcd
bootrec /fixmbr
bootrec /fixboot
```

Remove the Rescue CD and try rebooting the notebook.

Regards,

DP-K

Yeah, the thing with this is that no matter what I do, I can't boot up any installation media. I even tried to install OS on the disk in another computer, then install it in the other computer, but still it says the same error.

Even when I disconnect the disks, I can't boot up the installation media without getting this error.

Even when I disconnect the disks, I can't boot up the installation media without getting this error. I feel as if I had something similar to this a while back, which my end result was I un-done the case for my desktop, then started to clean out the insides and look to see if anything wasn't correctly put in place, turns out i knocked one of my RAM Cards which was knocked out.

Consider checking those, message me back after to see if the problem still persists.

Try booting into a Live USB of a Linux distro.

Nozemi™ - September 15, 2015, 11:07 pm

However, is there anything I can do with that Linux if I successfully boot it up?

Where are you getting the Windows ISO from how are you creating the Windows Setup DVD is the Windows Setup DVD legit if it was PC should boot to the Windows Setup DVD as it can boot to Passcape Windows Password Reset DVD/USB. Which version and edition of Windows OS install on your computer also which bit version.

Windows ISOs are downloaded from Microsoft's Volume Licensing website, which means they are legit. It's 64-Bit. I tried Windows 7, 8.1 and 10, which all of them were Pro versions I believe.

I used Rufus to create the USB, and Daemon Tools to create the DVD.

Will try when I have time. The computer is at work, and it's a private computer, so the priority is far down the list. I'll post back when I have time to try.
