Thread: [Trying to extract ads from page. Chromium/TWebbrowser](#)

sexxihexxi - September 23, 2015, 6:56 am

Hello,

Introduction:

Im trying to filter a webbbpage for ads like zanox or adsense (no i dont want to click them for profit)and get the link. If i open the page with a browser of my choice i can view the sourcecode. There i can find the link to the offer, which i would get to, if i would click the banner.

So, now when i get the sourcecode via twebbrowser control or chromium in delphi , i just get the javascript version of the ad and not the html link that is generated from the script, like in a normal webbrowser viewing sourcecode.

I should also note that the affiliate ads are within a iframe from a external domain. Could be this the problem ? if so why can i view the links with a normal webbrowser?

Hope you understand my problem. If not please write and ill try to explain it better.

If you need a example page,and some source i can provide them.

Could someone give me a tipp or help me to solve the problem and get the affiliate link?

Thanks for your time.

chromium for delphi project (CEF) on google code, then inject javascript inside the page when you need it uh?
