Thread: [\[TUT\] Get Paid Apps For Free \(AppCake\) \(video included\)](#)

Lacuna - September 24, 2015, 1:45 pm

Check out my other tutorials -

[\[Jailbreak\] How to get free songs and albums from iTunes \(Video included\) \(LinkTunes\)](#)

Step 1: Open Cydia and click the sources tab at the bottom. Click edit, add source and add the source repo.HackYouriPhone.org .

Step 2: After you've added the source click the tab search for AppCake and download the first one.

Step 3: Then head back over to search and look up AppSync and download the one call AppSync (5.X -> 8.X) This is a very important set or else when you go to download an app it will come up with a n error

Step 4: Now you will have an new app called AppCake open that up. Now go over to search and look for the desired app. When you have found it click download and choose any source. It will open up a web page and all you have to do is click the slow or regular download as other download speeds will need payment.

Step 5: Once the app has finished downloading click on it and hit install. Once it's installed it might ask for your apple id click cancel and the app should work perfectly!

How? I've not had any problems.

Then you're lucky. There are versions of appsync which can fuck with your spring board or anything more than that. Ask people around, Karen the dev also always says to only install the original from her repo.

Refer to reddit.com/r/jailbreak

U might want to consider adding a warning too: with appsync installed some tweaks might not appear on the springboard etc. Removing the tweak that doesn't show and respringing (or rebooting) then installing the tweak works. (may need to run uicache command in console or run icleaner)
