Thread: [\[Looking\] .PHP script what bind Downloader/file inside uploaded file.](#)

Furorem - September 30, 2015, 3:35 am

If title dont tell all i try explain it here.

Im looking a script for .php or html what bind downloader or my file to the uploaded file.

Im creating fileupload service and im thinking are that possible to make inside the .php code?

Step by step:

1. Someone upload hes file to my filehost.
2. My filehost bind downloader/file inside the uploaders file.

Basicly it infects uploders file with my file on the uploading step, and when uploading & binding is done that gives directlink/link to the uploader so he can spread that or else. ?

It's possible, but not in php, it's possible in C++

I might try this in the future for you

I might try this in the future for you! know that is possible with c++ ofc because there are lots of binders & downloaders on the market.

And i think this is possible with a somekinda serverside script and mine file uploaded on the server already, and maybe with Windows server not Linux.

Really dunno, still cant get rid of this because its major spreading. ?

I meant "server sided" C++, there use to be a popular online crypter that binded files and did what you're trying to do, but idk how much/how hard that is to make

Yep, im going to pay good reward for this if someone can make this happen. And we can maybe plan up something together with the code. ;)

The file hosting part is easy (there are tons of tutorials and free scripts already). Simply when the upload is done you can use `[url=http://php.net/manual/en/function.exec.php]exec()[/php]` to execute the binder (written in C++ or whatever you like) on the uploaded file.
