Thread: [Hacking vodafone station Huawei Routers](#)

onlinegamesnz - October 2, 2015, 7:31 pm

So, anyone know of a script to hack the ISP controlled vodafone station routers, or Huawei routers.

Ive tried a manual edit of the XML and re-uploaded but the settings dont change. Trying things such as opening VPN, adding a DMZ host and basic port forwarding.

Ive noticed these days most ISPs are going to remote management for most routers. There must be a easy way around this? Going deeper then the firmware?

Any ideas? Also if anyone wants some doe PM me add me on skype im networking experianced and CCNA certed so would be keen to pay for some hacking knowledge just basics and doing some digging etc. Hit me up!

Bump. Also I need to change DNS settings on this router, but only Vodafone can change them remotely.

Surely there is a way to change them. I have a VPN and need to route all dns traffic through the VPN.

Any ideas?

Cheers

Are you from NZ by chance? oh just saw your name - they have wps so you can use reaver to bruteforce the pin

onlinegamesnz - November 25, 2015, 9:20 pm

Thanks but I don't need a pic, I have full access to the router.

Unless they use a different login account?

What exactly are you trying to do with it ?
