Thread: [How To Turn The Source Code Into .Exe?](#)

charan20 - October 3, 2015, 11:54 am

i have downloaded a source code from the internet edited it and now i would like to compile it into exe but i'm not sure how to do it. can anyone help plz

Goodies - October 3, 2015, 11:56 am

What are you retarded? Use a compiler.

.Bux - October 3, 2015, 3:09 pm

In what language is the source code

Vector.A+ - October 3, 2015, 4:09 pm

What ? you edit source code without knowing the basics of computation and compilation ? omg , please watch a tutorial before trying to code. ;) It will make you a better programmer.

We all start somewhere... and he probably bought a source that defines what he needs to change

Download Visual studios, open the .sln(?) file, edit, and then "Local windows debug" then open the folder location and file should be ".../bin/debug/something.exe"

Mouse? - October 4, 2015, 2:40 am

That's not where you start though. You don't even learn a line of code before you know how to compile. lol

RRelayz - October 6, 2015, 4:27 am

oh god buddy you need to learn how to compile first lol use google to find out how to compile something in the language you are using like gcc for c

And if it's not a VS project?

If he just has a cpp file?

If he just has a cpp file?

Then teach him how to compile c++ code in his head. not difficult.

Mouse? - October 6, 2015, 12:41 pm

^ This. He can just write the object code himself in a hex editor.

420 Blaze It - October 6, 2015, 12:42 pm

I laughed at u lel

Just build the source.

Paul Wilson - October 6, 2015, 12:45 pm

What is the extension of the source file (file.c, file.cpp, file.sln, file.py, file.rb, file.*)

NTTITONV232 - October 6, 2015, 12:56 pm

Does it matter what the fucking extension is? I could have C code in a .py file extension and my compiler would still compile the fucking code.

In the end, the compiler's looking at the raw binary.

WildeThing - October 6, 2015, 1:26 pm

G++:

Code g++ main.cpp -o main

As for windows, I think it's the same but with mingw or whatever compiler/toolchain you're using.

SIM-1866423 - October 6, 2015, 1:39 pm

This post hurt my eyes ..

johnadrew - October 7, 2015, 8:47 am

gather the files, print them out, join and clip the printed a4 papers and use a glue to bind them up together once done, put it in water along with a USB flash for 24 hours, come back after 24hours and insert the USB flash in your computer, you will see two files, one name compiled.exe and another named: search on youtube or google how to compile the type of source code you have.txt

there you go, in just 24/h you are able to compile a fully functioning .exe file ready to be executed on your pc: enjoy.

Bit304 - October 7, 2015, 8:49 am

U can use compile the code? use VS ?
