Thread: [\[Help\] How to refresh a JPanel](#)

N3II - October 30, 2015, 5:11 pm

Hi, I have a JFrame, inside the JFrame I have 3 JPanel.

I want to change the middle JPanel with a setter, but when I do myframe.setMidPanel(new JPanel()); I still see my old panel

I tried stuff like remove/add/validate/revalidate/repaint but I probably did something wrong because it's not working

My JPanel contains a JTable

My code is something like

```
Code mainFrame.setpMid(vc);
mainFrame.remove(mainFrame.getpMid());
mainFrame.add(mainFrame.getpMid());
edit: I solved my problem with this:
```

```
Code mf.remove(mf.getpMid());
mf.getpMid().revalidate();
    mf.getpMid().repaint();
    mf.add(mf.getpMid());
    mf.revalidate();
    mf.repaint();
```

You can make a thread and in this thread you make a while loop that constantly checks whether the condition you set changes and when then does, it will update the panel :)

oh dear god

no

no.
