Thread: [Speaker static sound when my sound is turned off](#)

Kutt - November 26, 2015, 3:21 am

My speakers give off a static sound when all sound on my computer is turned off.

Could this be sings of malware?

Also, not too long ago I had to have my computer serviced and I believe my audio is running from the integrated sound card on my graphics card and not my motherboard.

How do I switch back to the integrated APU on my motherboard?

Senpie - November 27, 2015, 4:52 pm

This sometimes happens with certain type of speakers as I have had it happen to me before. So I am pretty certain it isn't malware that is causing it.

Are you able to turn the sound down on your speakers?

TwistedTechnologies - November 27, 2015, 11:20 pm

This usually happens to my headphones when no sound has played on them for a while. Does the static go away once sound starts playing?

Kutt - November 28, 2015, 8:51 am

It only happens when my sound is turned completely off.

About a year ago I had my computer serviced and I believe my sound is running off of my GPU onboard audio and not my motherboard's "realtek" APU.

How do I change this?

Honestly I wouldn't worry about it, it's just something that happens to playback devices after they've been used for a while. How long have you had them? All I can say is that you're definitely not infected.
