Thread: [Duplicate Data Gridview](#)

TheGreat1 - November 30, 2015, 6:50 am

Hi,

I have a grid view... Contact form.

How do I make it so users cannot use the same number to contact.

Contact number is stored in the database but if the users states the same number... the form shall not submit

I am using the InsertQuery on the SQLDataSource for the grid view.

check it against what you already have before you add/ update anything.

this seems more of a logic question.

How do I come across to doing that

this seems more of a logic question. Agree, maybe you can use a constraint on the db table if you dont want to code it in you app.

But you will need to check the output of the instert because of contraint exception

No shit dude but I'm stuck on 'How to find out if it exist in the table' rather than completing the statement

+Haze - November 30, 2015, 7:16 am

```
Code Private Sub btnSubmitForm_Click(obj, e)
```

```
    If DataAccessInstance.IsNumberExists(txtPhoneNumber.Text)
```

```
    Else
```

```
    End If
```

```
End Sub
```

Then inside your IsNumberExists Method

```
SELECT number FROM tableName WHERE number = @number
```

Check the row count. Return that as a boolean result.

Done
