Thread: [Please HELP ME - Regex multiple matches for multiple urls.](#)

FKTHEking - December 9, 2015, 12:26 am

I want to get certain values from different websites which I have in one file: D:\list.txt

Here is the code that I'm using.

```
Sub get_names
For Each Line As String In System.IO.File.ReadAllLines(D:\list.txt)
Dim currentsource As String = New System.Net.WebClient().DownloadString(line)
Dim Jolu As String = "(?<=names:")(.*?)(blabla) 'Not here is my problem
Dim ParseNames As MatchCollection = Regex.Matches(currentsource, Jolu)
Next
Next
End Sub
```

Please help me! It's urgent! ?

BahNahNah - December 9, 2015, 12:30 am

Loop through the values in Regex.Matches.

FKTHEking - December 9, 2015, 12:42 am

For my shame I don't know how to do this. I searched everywhere to get a way for looping, but I still don't get it. :(

Your iterator should be of type Match. You can then read (typical) group 1's value.

Josh? - December 9, 2015, 12:58 am

You already have a loop for System.IO.File.ReadAllLines
