Thread: [Samsung Galaxy Note - Boot loop](#)

donethatbeenthere - December 9, 2015, 8:32 am

Hey guys,
My Galaxy Note has some issues:

Boot loop
Can't connect to PC
Not charging

I've tried:

Factory restore
Installing drivers on PC
Charging with its original cable

It is not rooted, and I don't even know what to do anymore. Help will be appreciated.

Note *haha*: I don't know very much about Android, but I know basic stuff like getting into Recovery mode etc.

Exynos. - December 10, 2015, 3:16 am

Connect it to pc in download mode and flash the firmware using odin

howard2525 - December 10, 2015, 3:18 am

What exynos said is almost the only way...

donethatbeenthere - December 10, 2015, 4:29 am

But my PC won't recognize the phone, and when I try to get into Download Mode it says that the battery is too low, I've tried taking the battery out and charging it with a battery charger (not using the phone itself)

Exynos. - December 10, 2015, 4:48 am

Install the drivers for your device on pc
it should detect it

Tranquility - December 10, 2015, 4:53 am

Try getting the ADB drivers working: [see here](#).

donethatbeenthere - December 10, 2015, 4:58 am

I can now recognize the phone. I've tried the stock roms with Odin but it says FAIL!. Am I doing something wrong? The phone is not rooted.

Tranquility - December 10, 2015, 5:07 am

Which exact model do you have?

Samsung Galaxy Note 4 N910....? the dots are to be replaced with F, N, K, C, S, L whatever is your type.

donethatbeenthere - December 10, 2015, 5:08 am

I guess it's a Galaxy Note 1. (N7000)

The phone doesn't need to be rooted

Are you flashing the right file .tar ?

donethatbeenthere - December 10, 2015, 5:11 am

Yes, I think so: N7000XXLT5_N7000XXLT3_N7000XENLT1_HOME.tar.md5

I am from the Netherlands, phone bought in the Netherlands too.

You'll have the N910F (Europe) edition most likely in that case. I'll search for a stock ROM.

Edit: There's [KIES](#) from Samsung to update/flash software.

Here's a [mirror](#) for stock ROMs for the latest update (November 2015). It should give you Lolipop 5.1.1.

Seeing you already have ODIN there's no need for a link to that I guess.

These tools should be able to help you out, if not there's more going on and we'll need more details regarding the possibility to send it in for repairs.

Bumpin cuz still not fixed guys.. Share your mind <3

donethatbeenthere - December 12, 2015, 10:30 am

Still not fixed.. still doesn't work.. cam on pieps.

donethatbeenthere - December 15, 2015, 1:47 am

Errrr... still not fixed and it's getting pretty annoying..

6LACK EA6 - December 15, 2015, 6:05 am

Hey there, you're gonna try a few things and see where that takes you.

First and foremost, I was reading the thread and didn't really understand whether your device is n7000 or N910F or another model, please find the correct one since it is crucial for the process.

Regarding Odin, it's a really tricky application and it's quite a hassle to get it working. It recognizes the device but then doesn't flash it and various other scenarios can happen with Odin.

Here are a few things that you can do when Odin gives errors:

Change computers

Re-install proper drivers (which you already did)

Use different USB cable

Use different USB ports

Different version of Odin (you'll need 3.07 in this case)

Now why did the device enter a boot loop? Did you install/experiment anything with it?

Either way, you're gonna try again with a different firmware this time.

Click google.com/uc?id=0B0nsPzgBpELgLU15dTBkRW13S1Ujhere to download the UK firmware for your device, since you're trying to fix your device and it doesn't really matter that much.

Same procedure as always:

Download Odin 3.07 from [here](#)

Extract Odin and firmware file you just downloaded

Make sure phone is charged

Put phone in Download Mode

Open Odin

Connect Device with your computer

Wait until it shows on the left side box

Click on PDA, select the .tar extracted file

Hit Start

If you've used different cables, different USB drivers, different computers and Odin still doesn't work then I'm afraid you're out of luck.

Note: The firmware download link I provided above is for the N7000 model, please double check your device's model before you continue flashing.

donethatbeenthere - December 15, 2015, 8:06 am

It's the N7000, but I already tried that bro.. I think it's hopeless tbh

6LACK EA6 - December 15, 2015, 8:16 am

I guess the most important thing here is determining what you actually did to the device that it got bricked? They don't just get bricked without playing around.

donethatbeenthere - December 15, 2015, 8:17 am

Well, you know I am not the only one that has tried fixing this phone, as I let my friend try too, idk what he's done with it but mhm ok, thnx tho..

Now as far as the issue, if all you're getting is a boot-loop, it is totally fixable
