Thread: [If a code is in db I want it to generate a random #](#)

CodeBinary - December 12, 2015, 3:33 pm

Heres what I got:

```
Code <?php
require("inc/connection.php");
if ($link->connect_error)
    die('Connect Error: '.$link->connect_errno.': '.$link->connect_error);
$insertedcode = $_POST['code'];
// $results = $link->query("SELECT code FROM code WHERE code = :code");
$query_string = "SELECT code FROM code WHERE code = :code";
$query_params = array(
    ':code' => $_POST['code']
);

$stmt = $link->prepare($query_string);
// $stmt->bind_param('s', $query_params[':code']);
$result = $stmt->execute($query_params);
$row = $stmt->fetch();
if($row) {
    $number = mt_rand(0,3999);
    echo $number;
}
?>
```

But it doesnt work i get this error please help:

Fatal error: Call to a member function execute() on a non-object

RedWaters - December 12, 2015, 3:42 pm

Since \$link is supposed to return an object on prepare I guess it returns a bad result, checking out your query

Code SELECT code FROM code WHERE code = :code You should specify the column as code.code

As per the documentation, PDO will return false or throw an error on failure.

Obviously it is failing. Set the PDO error mode to PDO::ERRMODE_EXCEPTION then catch the exception and examine it's message to find out why your query preparation is failing.
