Thread: [Button to download Img Src](#)

Wide Awake - December 20, 2015, 6:21 am

Alright guys so i got my website working..

Now i came across the last problem.. at least i hope.

On mobile, if the user holds the image to save. They will get the actual img url on top of the context menu.

I do not want them to see that.

So my only option is to implement a download button.

I'm not sure exactly how to make a button download image src with an id tag?

If possible.

Weird, google didn't pick that one up.

Anyways although that wasn't from a button. I'll just make a button from an image and use that solution.

Thanks man!

btw welcome to the forum!

EDIT: Yeah no this won't work. You see the image will be different all the time. So that means it will contain a different image link.

I can't set up a static href.. what can i do?

Vex-Enterprises - December 23, 2015, 7:32 am

how are you making the image different?

would you be able to do like an `<a href="" download>` within the code that brings up the images?

.trigious - December 23, 2015, 8:13 am

Hey. Just read you found your solution, but I wanted to suggest a little technique you can use to not

allow the user to download the image while holding it. Atleast this works on Desktop:

HTML

```
Code <div id="parent">

  <div id="overlay"></div>
</div>
```

CSS

```
Code #parent {
  position: relative;
}
img {
  height: 300px;
  width: 500px;
}
```

```
#overlay {
  height: 300px;
  width: 500px;
  position: absolute;
  top: 0;
  left: 0;
  opacity: 0;
}
```

There's also an HTML5 attribute called "download".
