Thread: [Ultimate guide on Monitoring Software: Complete Keyloggers \[TUT\] 2015](#)

priyanka11 - December 24, 2015, 8:59 pm

A keylogger is a surveillance program which is considered to be either a spy software or spyware which has the capability to record every keystroke which you type in the keyboard, it makes a log file usually in an encrypted form. Keyloggers monitor each and every keystroke a user types on a specific computer's keyboard. A keylogger known as a keystroke recorder can record instant messages such as e-mail passwords, Facebook password, Gmail passwords and any information you type at any time using your keyboard. A keylogger program can be installed just in a few seconds and once installed you are only a step away from getting the victim's password. Keyloggers can be helpful and can be risky. Employers may find that it is one of the best spy software to monitor their employees (Read more about employee monitoring software). Others may find it absolutely dangerous since it's easily installed and greatly invisible (works at desktop background) and password can be hacked in easy ways using keyloggers.

How keyloggers work with example?

When a keylogger is installed on a PC, it starts operating in the background (stealth mode) and captures every keystroke of the victim on that Laptop. Let's take up a small example: The victim goes to <http://facebook.com> and types his username as "BLACKLISTHACKERS" and the password "BLACK@123" in the respective fields to login. The keylogger silently records these keystrokes and stores them in the logs; these logs when opened up show the captured username i.e. "BLACKLISTHACKERS" and password as "BLACK@123" and will also tell you that they were typed in the Facebook login page. Thus the keylogger loads upon every startup, runs in the background and captures each and every keystroke.

Below are the two major types of keyloggers:

Types of keylogger softwares used in Windows 7/8/10?

1) Software based keyloggers:

Software based keyloggers are essentially programs that aim to monitor your computer's operating system. They vary in types and levels of system penetration. One example of which is memory injection software. These are typical Trojan viruses (Read more about How does Trojans and backdoor work and how to prevent these viruses) that alter the memory table of a system in order to bypass online security. Another example is a form-grabbing based software. This controls the forms submitted online and essentially tracks all the information a user puts in every form.

[img]http://blacklisthackers.com/wp-content/uploads/2015/12/feature_img_1.jpg[/img]

Remote Keylogger offers users the ability to remotely monitor a computer via a web browser, without even having physical access to the PC. It will allow you to remotely install the monitoring

system through an email attachment without the PC user recognizing the installation! And you can access the activity logs from anywhere via your favourite web browser!

Software based keyloggers are more dangerous if there are additional features for each. They can be very hard to detect that's why it takes a lot to remove them.

2) Hardware-based keyloggers

Hardware based keyloggers are totally different from software based keyloggers as they don't need any installing since they are already within the physical system of the computer. It may be in the form of pendrive and keyboard port. Hardware based keyloggers can be categorized into two parts:

[img]<http://blacklisthackers.com/wp-content/uploads/2015/12/hardware.jpg>[/img]

-Keyboard keyloggers: These keyloggers are one of the most common examples of hardware-based ones. It monitors the keyboard keys a user presses and then records it secretly.

-Acoustics keyloggers: These keyloggers record the sounds of the keys pressed by every user. Since each sound is unique, it is possible to predict which key it is.

Keyloggers can either be evil or good. Considering there are so many types of keyloggers out there, one should always be very cautious. So whether you're installing something or a hardware device is plugged into your computer, better be careful every step of the way.

Now the main question? Is your online order 100% safe and secure?

Absolutely yes! All the e-commerce transactions for sniperspy is handled by blacklisthackers community—trusted online retailer specializing in digitally delivered products. All your information will remain private and secure. The safety and protection of your personal information is 100% guaranteed. So you can place your order for sniperspy with no worries of scam. [For more inquiry you can contact us at anytime.](#)
