Thread: [\[SOURCE\] Twatter - Fetch username lists + Tweet targeted users! || Twitter Bot](#)

qbakkali - December 29, 2015, 5:26 pm

I can't post links or images. You will need to copy and paste the link into your browser.

Twatter

Search & Post Tweets on Twitter using tweetinvi C# library.

Screenshot

i.imgur.com/Bx0C1qY.png

Features

- Search by phrase or by users followers
 - by phrase: Get username, hashtag used, and the tweet
 - by user followers: get followers usernames
- Tweet by phrase or by user followers
 - by phrase: tweet people using the phrases that you loaded into the Twatter, with tweets that you have loaded as well.
 - by user followers: tweet desired user followers with a random tweet from the tweets you loaded.
- Get user stream (current logged in user with Twatter)
 - notification when you tweet
 - notification when someone follows you
 - notification when you unfollowed someone
 - notification when someone sends you a direct message

Next Update

- Fix `by user followers` option to be able to be used as an option. (Right now only by phrase works).
- Add functionality to Delete Tweets button, Retweet, and Favourite button.

Download [Github]

github.com/qasimalbaqali/Twatter - Twatter on github

How To

1. Download the repository.
2. Open the solution on your favorite Visual Studio.
3. Get your API keys from apps.twitter.com
4. Replace the API keys in Authentication.cs on line 20 with your own
 - `TwitterCredentials appCredentials = new TwitterCredentials(consumerKey: "XXXXX", consumerSecret: "XXXXX");`
5. Build the solution, and have fun!

Notes: There are a lot of bugs here and there.

YOU WILL NEED TO BUILD THE SOLUTION. This was a 3 day project, but I am open in adding

more features and removing all bugs.

I don't have much experience with C#. I picked up the language from school. Just two months since writing my first C# code, so don't expect a pro level program. The API keys that I provide are read-only. So you can only search for users and export them to excel.

If you find a bug please open an issue in the repository.

* I don't take any responsibility on how users use Twatter. Use at your own risk, and please don't spam the shit out the API. I created this program as a fun way to get to know C# and how I can use it, that's all. Educational purposes.

The link is in the thread, github link to the repository github.com/qasimalbaqali/Twatter . You'll need visual basic to build the program and use your own twitter API keys that you can create on apps.twitter.com

This should be in <https://hackforums.net/forumdisplay.php?fid=208> not here.

The control alignment makes me cringe.

Nice... i see you're using Tweetinvi as well, i use it too in my auto responder program.

Why are you calling Application.DoEvents(); inside a child thread ? I would recommend you to use Tasks instead of old traditional Threads.

On the bottom line, this program needs some serious refactoring.
