Thread: [Need help with injecting](#)

**irishsecurity** - January 3, 2016, 10:49 am

Hello. So i did a uniscan and acunetix test and both came positive for sql injection but i cant seem to find a place to inject. Can someone please help me out glenceltic.com

What was the output of the scans that your ran?

**irishsecurity** - January 3, 2016, 11:00 am

it came up with sql injection verified

tnx to MR O\_O ..

you should upload scan result ..

server on your target :

Code Apache/2.2.29 (Unix) mod\_ssl/2.2.29 OpenSSL/1.0.1e-fips mod\_bwlimited/1.4 Server at www.glenceltic.com Port 80

send your result ..maybe in result ..we can find thing ...

scanner = helper

good luck

Usually i don't help people who just run scanners, but we can learn something here...

The only place an injection could take place is this the "pageid" parameter here:

[http://www.glenceltic.com/index.php?pageid=\[SQLi\]](http://www.glenceltic.com/index.php?pageid=[SQLi])

But i checked back on this and it seems to be not vulnerable.

Thus, Acunetix produced a "false positive" result... and that's why you not use scanners ?

Cheers, Gee.

I never use scanners. Unless it's nmap or Nessus. Everything else has false positives basically. Learn to find vulns manually.
