Thread: [Decryption Tool for TeslaCrypt](#)

Knautschtabak - January 4, 2016, 11:12 pm

TeslaCrypt is a ransomware, whose latest version left encrypted files with the .vvv extension. There have been lots of cases also on HF with people asking for decryption help. Turns out that there is finally a tool that is able to decrypt the files. It was created by Googulator.

Link: <https://github.com/Googulator/TeslaCrack>

Description from Github:

This is a tool for decrypting files that were encrypted with the latest version (variously known as "v8" or "v2.2.0") of the TeslaCrypt ransomware. This new version can be recognized from the extension ".vvv" added to the names of encrypted files, and the file names of the ransom notes being "Howto_RESTORE_FILES.txt". The tool should also work against other recent versions of TeslaCrypt - for ancient versions, use tesladecrypt or TeslaDecoder together with the Bitcoin-based key reconstructor instead.

The usage is on the website. If you need any help, let me know.
