Thread: [PHP Image Uploader - Add another extension](#)

Exodi - January 6, 2016, 4:31 am

So I have a PHP file uploader to upload files with a watermark on it.

It totally works and it's a great script.

But it only allows JPG and JPEG extensions, and I'd like to add PNG.

I already tried this:

PHP Code

```
<?php
```

```
if ($_POST['submit'] && $_FILES['userfile']['size'] <= $maxkb && !file_exists($path . $_FILES['userfile']['name']) && $_FILES['userfile']['size'] && is_uploaded_file($_FILES['userfile']['tmp_name']) && (strtolower(substr($_FILES['userfile']['name'], -3)) == "jpg" || strtolower(substr($_FILES['userfile']['name'], -4)) == "png"))
```

but that doesn't work. (only the JPG and JPEG works, but I tried to add PNG but only that doesn't work)

FULL PHP CODE: <http://pastebin.com/QZeigMVw>

it was too large to post on HF

Tl;dr: I need PNG to be allowed as file extension in a PHP script

```
Code if ($_POST['submit'] && $_FILES['userfile']['size'] <= $maxkb && !file_exists($path . $_FILES['userfile']['name']) && $_FILES['userfile']['size'] &&
```

```
is_uploaded_file($_FILES['userfile']['tmp_name']) && (strtolower(substr($_FILES['userfile']['name'], -3)) == "jpg" || strtolower(substr($_FILES['userfile']['name'], -3)) == "png"))
```

The substr() for PNG only needs to be set to -3.

Having it set to -4 means it goes back 4 characters and would be capturing ".png", so it would return false as you are comparing it to "png".

Bit of a stupid way when you can just get the MIME type of the file. Ref:
