Thread: [Index of / - .php files when saved don't show](#)

Skidy - January 8, 2016, 12:57 pm

I found a websites wp-include's directory and they hav't hidden parent directories. Meaning I can view files like this:

However, everytime I right click and save link as for a .php file. It saves and nothing is in the file. How can I download these files to see the php code? They can't just be empty documents.

Exodi - January 8, 2016, 12:58 pm

It's impossible. Otherwise you could download the config.php and just hack it actually.

Delevingne - January 8, 2016, 12:59 pm

Are you serious? Are you 100% serious? Or just a bad troll?

Mr.0_0 - January 8, 2016, 1:00 pm

You cant download them via a browser or using the CLI. For one, you can use a browser because you dont have read access to the files and you cant use the command line because PHP is server-side. Unless you can change the privileges on the server itself pertaining these files, thats all youre going to get: a directory listing. If someone tells you otherwise, theyre bullshitting.

EDIT: Holy crap lol i seen all these replies when I submitted my response. I stand corrected.

Try to find a other vulnerability, since php is a server sided language you wont see a thing, however if you find a LFD, or an lfi where you can use the base64 encode, then you can get the php code

#Skyline - January 9, 2016, 3:42 am

I laugh at the php file part.

And you cannot see anything as PHP is server sided.
Try finding a vuln, as stated above.
