Thread: [Compare item to SubItems 2 different listview](#)

OneTXxL - January 30, 2016, 9:55 pm

Hello thank you in advance for your help, say my columns contains the ListView1
| Title | length | Artist | album | year |

and that contains listview2
| Album | length | weight | Directory. |

I would compare the name of the album and find the ListView1
listview2 album and then recover the weight.
Thanks for your help.

PHP Code

```
<?php
For Each item As ListViewItem In ListView1.Items
    For Each item2 As ListViewItem In ListView1.Items
        If item.SubItems(3).Text = item2.Text Then MessageBox.Show("Same")
    Next
Next
If this is what you want?
```

    Next
Next
If this is what you want?
```

You'll want to exit the loop blocks to conclude the search, unless you're searching for >1 match, in which case break only from the nested loop.

Yes i will end loop if result is found , but that depends on user how much name he wants to compare

PHP Code

```
<?php
For Each item As ListViewItem In ListView1.Items
    For Each item2 As ListViewItem In ListView2.Items
        If item.SubItems(3).Text = item2.Text Then MessageBox.Show("Same") : Exit For
    Next
Next
```
