Thread: [Accessing other through my network?](#)

N33t - February 10, 2016, 1:17 pm

Is there any program that allows me to access other devices from my computer that are connected to my network? Like Iphone / Windows computer / Mac.

That allows me to view their library / documents and so on?

Something that dont need me to physically touch their device?

You can do this quite easily using Kali Linux. However depending on the operating system you're attempting to get into, it may be more difficult. The newer the OS, the harder it will be. Also keep in mind, by "quite easily" I mean quite easily if you know what you're doing. If not, it will take a few days of research and testing to gain the knowledge to perform these attacks.

You can use Kali to attack them in various ways including MITM attacks, shell injection, phishing and traffic redirection.

There's also a windows program, although I don't recall the name, however you're better off using Kali.

I also suggest you don't get Kali 2.0 as it's horrid.....get the original kali.

If i wanted to access mac / iphone? Do that program work?

Is it hard to set up? Are there no other programs that is done, just install and god to go?
