Thread: [Enhancement of security with Fud Functionality of Cryptor\[24*7 service\]](#)

cyberexpert - February 14, 2016, 10:54 am

Hello hackforum

First of all I would like to thanks to hackforum they gave me opportunity to being a part of this technical field.

whatever my knowledge about all these tools and services i would like to share with you all and in this thread i am sharing my reviews about crypter and functionality and whoever need to get my tools they can contact me on skype

I have build my immortal crypter just Do contact me and the advancement and features are brilliant specially the interface design and modules.

? sniper.experts ?

What is Crypter?

Crypter is software used to hide our viruses, keyloggers or any RAT tool from antiviruses so that they are not detected and deleted by antiviruses. Thus, a crypter is a program that allow users to crypt the source code of their program. Generally, antivirus work by splitting source code of application and then search for certain string within source code. If antivirus detects any certain malicious strings, it either stops scan or deletes the file as virus from system.

What does Crypter do?

Crypter simply assigns hidden values to each individual code within source code. Thus, the source code becomes hidden. Hence, our sent crypted trojan and virus bypass antivirus detection and our purpose of hacking them is fulfilled without any AV hindrance. Not only does this crypter hide source code, it will unpack the encryption once the program is executed.

Further I have modified and arranged the data in tools so get the Fud crypter

What is FUD?

FUD is acronym for Fully UnDetectable. With increased use of Crypters to bypass antiviruses, AV became more advanced and started including crypter definitions to even detect crypter strings within code. So, use of crypter to hide Ardamax keylogger and RATs became more complicated as nowadays, no publicly available crypter is FUD.

So, if you crypt RATs with publicly available crypters, they are bound to be detected by antiviruses. This is because most FUD crypters remain "FUD" for maximum of one or two days after their public release. To obtain FUD crypters, you have to either search for it in hacking forums or make one

(which is somewhat tedious.. I am working on this).

For any kind of assistance contact me on skype .
Give me a chance to deliver my best to you all .
thanks .

Why make a tutorial when you dont understand the basics yourself? :|
