Thread: [The Ultimate Dork Scanner](#)

Ooze - February 24, 2016, 2:23 pm

I found this in my notes a from about a year ago when I tried to hire some programmers for this cool idea I head for an SQL Injector.

Its a bit late and I wold still like to see this project made however you can do it on your own thats why I'm not putting this in the Buyer's Bay.

This was what I was looking for

1. Ability to scan more then one dork at a time. At least 100 dorks at one time.
2. Ability to get an exact number of results per dork.
3. Ability to choose between search engines i.e google, bing, or yahoo.
4. Ability to determine which site is SQL vulnerable.
5. Ability to scan each site for page views, login, and web shop features.
6. Ability to save SQL vulnerable sites.
7. Ability to order the sites based off of # of page views/login/ web shop feature

Ya a little impossible but the main key was #5 where I wanted it to look up like webshop.php to see if that brought back a result and then it could more or less determine if this site had a shop.

I though this would save time so you wouldn't inject unless sites.

Please tell me your ideas and if this is even possible
