Thread: [**FREE CLOUD-BASED HOSTING WITH NEXT GEN CGI+MySQL**](#)

Sadler - February 24, 2016, 3:52 pm

Hello, I have been working quite some time on putting together a replacement for PHP, this replacement has come in the form of osp/au3(autoit).

This means you can easily use autoit syntax, functions, udfs, coms, dlls, everything you can do with autoit, you can use within webpages you build(you can even make web-apps)

I am looking for five people interested in using the osp system, for a closed beta, to test the limits and capabilities of the language functionality.

Anyone can be a beta tester, if you are totally new to autoit, or an advanced user, or anywhere inbetween, if you have previous experience with php, or any similar language (basic, java, etc) this should be a breeze for you as well!

You will be provided cloud based(google drive) access to your document root, you will be provided hosting through google drive(so you need a google account).

You will also be given a mysql database.

WE PROVIDE FULL SSL COMPLIANCE W/CLOUDFLARE.

Use as many domains as you want.

All file modifications will be archived within the cloud(archive) as well, dont worry about loosing your changes or work.

If you are interested in testing this new web development platform, please make a reply stating what current experience you have, and then pm me your skype info.
