Edited once more, no more reading thanks

?????II?? - February 25, 2016, 11:00 am

hmm finally someone who made a tut for this so newcomers wont ask it over and over again

great job!

Mister Guwop - February 25, 2016, 11:03 am

Thanks man will help many new users.

SZPZ - February 25, 2016, 11:05 am

Yay thanks, however I bet tons of new members will still ask this question lmao.

yeah probs but this will help some of them.

(i)(c)(u)(r)(u)(o)(k) - February 25, 2016, 12:00 pm

You should add to the hack you,

Like as in if the IP has a socket server running and forwarded past firewall/modem then "you" might easily become hacked. For example IP is hosting a apache server on a version that is exploitable then a simple socket payload sending the exploit would allow you to hack there system multipule ways.

Hell even some RAT socket servers can be exploited in a way to allow you to gain control of the "hackers" system.

So I would add that hosting a socket program/service and forwarding past your firewall/modem "which pretty much any good RAT requires" might be a way of allowing your system to be exploited.

No offense but I think if someone is worried about getting hacked with there IP I don't they will understand this.

But its something to keep in mind

Ya IM hoping we can just link them to this thread.

But we can't win every battle

SysAdmin - February 25, 2016, 2:12 pm

Great thread, although i'm afraid that in a couple of days, it'll go down the pages fairly quickly, and there will be people still asking this question.

If only this were stickied

HINT HINT OMNI

Of course that would never happen

but something more indepth should be stickied

It should. But you have more of a chance to win the lottery before this or any similiar help threads get stickied.

To the hack you part :

An experienced hacker could use metasploit and try to hack your pc

ONLY if target system is in LAN or has open and forwarded ports past firwall/modem hosting socket services.

Pretty much no one can do crap with your IP give, You have no open socket ports being forwarded in router/modem and have upnp turned off.

They can get the location of the internet provider your using not your location itself.

Can do some weak dox on the IP to get 80% false positives.

Can ddos attack you if you have open ports or upnp ports forwarded, Or a VERY weak ISP.

Bulgarian - March 7, 2016, 6:50 am

Great thread, homie. Nice work! It'll definitely help out a bunch of people

SIM-3063187 - March 7, 2016, 7:25 am

Nice post. Thanks! So we all should be using VPNs?

0x0x0x - March 7, 2016, 7:33 am

Good thankyou for information

Deveser - March 7, 2016, 7:57 am

Nice tut bro ! keep writing this is helps a lot ! :)

kmz22222 - March 7, 2016, 9:36 am

That thread tho... instant cancer....

"hacking with an ip" ?

really?....

I have tired countless times to do such thing... it was a huge failure.

You could have just stated in the thread "noone can do shit with your ip. the end."

And how do you say that someone can hack you with your ip then you said:

(Feb 25, 2016 10:42 AM)C0deZilla Wrote: [\[CITE\]](#) someone has your IP they won't do shit.
Instant cancer...

Exchange.Service - March 7, 2016, 10:02 am

good post!
thanks for the info

legit-tick - *March 7, 2016, 10:19 am*

Any suggestions on a program that pulls IPs?
