Thread: [I will custom code your requested software FREE](#)

(i)(c)(u)(r)(u)(o)(k) - February 25, 2016, 6:12 pm

Just wanted to let people know that even though I custom code my tools/programs from scratch no open source used.

<https://hackforums.net/search.php?action=finduserthreads&uid=2192943>

I get users claiming they are smarter and better than me because they know how to edit open source LMFAO.

I am making this thread as a almost service offering.

Ask me to create a program for windows and ill make it.

Simple as that.. request a custom program and I will reply to your request and provide the program I custom coded as per your request.

This is to try and prove to some of those HF users who think im retarded because I dont use open source. And other users thinking I dont understand networking/internet protocols.

Working on current request - Expected end date 2/29/16

If you make a request expact due date past above date.

PMing you now :)!

Hope you could do this.

?Synapse - February 25, 2016, 6:14 pm

Can you make me an Instagram/Twitter Turboer?

version1 - February 25, 2016, 6:15 pm

PMed you about this, looking to hear from you.

Interesting... to be honest a website ripper I have never made, And Udemy (warez disallowed) host these courses using custom php/sql classes.

So without hacking into the database or uploading a shell provides a huge issue. As there is no way to rip the data.

A converter might be possible to convert/download a free course.

If you could make me a simple SOCKS5 server that supports plaintext authentication, that'd be pretty nice. It would need to be non blocking IO and support a couple thousand concurrent connections without an issue.

If you could add MySQL based authentication on top of that, it would be even better.

I should have this by the end of the weekend with no issues.

pming about this, i am looking for something simple :)

Nicktron - February 26, 2016, 12:54 am

What language will you code the requested programs in? :)

wander is a multi dwc - February 26, 2016, 1:00 am

I can code both socket level programs in C++ & Lua.

I like to use pure lua though as I can code a single executable to have multipule library and socket support. Also creating GUI program with the language is even easier to do than C++ with the IDE I use.

Also the programs will have native support for xp-10 for the most part and will require no .net dep/updates.

All the support needed I can create within the lua program itself, And if the requested program requires maybe a driver install at most.

But im working on about 4 tools already so it will be a little while till I can add you to the list.

Llama™ - February 26, 2016, 1:17 am

PMing you about this right now.

TiOneDDoSso - February 26, 2016, 1:25 am

PMd you mate, glad to see someone help out community

amg64 - February 26, 2016, 1:54 am

Just PM'ed about the requested software :)

Insane Developer - February 28, 2016, 3:15 am

An authentication builder

So basicly like NetSeal but you can drag the software into the builder and choose where the licensing PHP files are.
