Thread: [No beep post after bsod \(during system reset\)](#)

NiceMe.Me - February 26, 2016, 7:24 pm

So I was resetting my pc because it was starting to run a little slow. It got to a full 100 percent then restarted. It booted up to a bsod saying critical_service_failed or something along the lines. Then it restarted to a black screen with no beeping so im guessing it didnt pass POST? I have a video of what the computer does upon booting it

h tt ps: //w ww.yo ut ube . com/w atch?v=FH4W 1Q6xDQU

Please assist me with this issue thx

ok wow its been a day and not even 1 person has attempted to assist me nice.

What did you get to 100%.

What do you mean resetting? Power button held down?

So if you turn on pc right now will it boot then bsod?

Or it just stays at the black screen when you power on?

If its just a black screen power it down. Up plug the sata/ide cable from the HD note the cord you unplugged. Plug back in when the pc is off and the test is over.

Try to boot and get into bios?

Still black screen?

Try to check if you have more then one display adapter you can try to use

Well idk i need more info.

?
