Thread: [USB spreader?](#)

**CrypticX** - February 29, 2016, 2:42 am

Hi there

I was wondering if it is still possible to infect usb sticks? If so, does anyone know where I could get one?

Thanks in advance ?

**SysAdmin** - February 29, 2016, 2:43 am

You can, but you'd have to manually run the USB, as AutoRun features have been disabled in latest versions of Windows (7,8,10)

Heard about that, but what exactly do you mean by "manually run the USB"?

**SysAdmin** - February 29, 2016, 3:01 am

As in, put in the USB and manually run the stub that you've put on it.

Oh ok damn it, thanks a lot for the answer though ?

**Insane Developer** - February 29, 2016, 3:06 am

Or you can use the .lnk method

It works, however not FUD

Rubber Ducky: <https://hakshop.myshopify.com/products/usb-rubber-ducky-deluxe>

Teensy: <https://pjrc.com/teensy>

BadUSB: <https://github.com/adamcaudill/Psychson>

Basically what you want. Either of them will be able to auto run your stub or do whatever you want within your custom payload when inserted into PC. It's all automated, no need to even press a key.

They have some payloads here for example, but you can code it to whatever you want to do.

So this basically means its still possible to autorun, right? I'll look into that a bit later, thank you ?
