Thread: [How do I Play a video on C/: using custom media player](#)

webwarlock72 - March 6, 2016, 12:31 pm

I've made an application that when installed puts a folder called "Video" containing 3 videos in to "C:\Program Files\.

The videos are tutorial videos. In the help menu there are 3 topics one for each video. I've made a custom media player in my application. What I want to do is use this media player to play the video that's selected. I can easily assign one video to the player but how do I have it play the video selected in the help menu.

I don't want to have to make 3 media players

I hope this makes sense. I'm not good at trying to explain things

Thanks

On a click/doubleclick event

MediaPlayer1.URL = "C:\Program Files " whatever""

Thanks CaptainCaveman. worked a treat :)

VideoPlayer.Show()

VideoPlayer.AxWindowsMediaPlayer1.URL = "C:\Program Files
(x86)\Assistant\video\SetUp.wmv"

Why do you claim to have made a custom media player when you're using Windows Media Player?

Im not claiming I've made it. All I've done is give A facelift to look the same as my app.

By "I made it" he means "I copy/pasted it"
