Thread: [NEW | Basic Anonymity Guide For Beginners | safe computer used](#)

Kabbalah - March 6, 2016, 7:54 pm

1,testing new hacking toolz ,,, or any hacking related for your study
answer = use separate computer and internet in a different location

2, vpn and new identity
answer = tor is always better then most vpn out there , change host name, change mac address ,before you log online,,,and use a new identity fakenamgenerator.com ,,, and history,cookies remove when browser closed

3, shadow defender or time freeze & sandboxie
answer = nice security always have them on

4,never no did nada why
anwser = worms can spread from your computer to everybody in your area .so if you have white friends like armada and they are rich they can be the next victim with bacteria ,,,so think again if you want to do your hacking at home ,,,

and your other computer at home that you use for banking n other private stuff use separate internet ,the only thing you need to download on that Pc is shadow deffender and a vpn ,NO surfing the web with your private computer

let be real for now ,,, no software you can trust unless you understand how it was build and can tell your self this is legit ?

backbox OS anonymous mode
windows OS is for general use
TAILS OS is super anonymous mode - throw away the dvd when you finish

there's always a better setup ,but this subject says Guide For Beginners
