Thread: [Centering plain images](#)

Profatssor - March 12, 2016, 5:02 am

My question is not about centering an image on a webpage, I'm well aware of how to do that in html/css. What I'm wondering is for an image that is hosted on my site, [for example this one](#), is there a way to center that?

Firefox automatically does this, but in chrome, the image just gets pushed up to the top-left corner.

I have apache on my server and I was wondering if there is a way to make it use a template or something to display all images on a default page.

Edit: I was thinking I could use apache rewrite rules to redirect any requested image to another page, but how would I make that page contain the specified image?

If you can help me out, leave a post or PM me. Cheers ?

I don't quite understand what it is you are asking for help with, are you trying to center just one image or multiple or? I think I am reading the post wrong or something.

I read it wrong first too.

Basically, if you open the image in the browser (Chrome), you'll see that the image is in the top left corner. But if you open the image in Firefox, it is centered.

OP: I believe its just what the browser does.

That is browser dependent, when you view an image you are view an image file not a webpage.

Concise and straight answer. Thank you.
