Thread: [Detect Website Hidden CMS Version For Exploitation](#)

Redshadow - March 15, 2016, 11:28 pm

Hi everyone

I am new here, please dont be angry by my question. I used CMSmap, Wappalyzer Addon, Appspector Addon, CMSeye Addon, Chrome Sniffer Addon, W3techs Addon and Builtwith Addon to detect a targeted website plugin details, operating system details, webserver details but I could not detect the CMS version of that particular website I want to exploit.

I also checked the website robots.txt and it disallow administrator, disallow admin, disallow logs, disallow tmp, disallow cache, disallow installation, disallow cli

I think the website is running on joomla but I am not 100% sure

I need your advise on detecting website hidden CMS version?

Please leave a comment. Thanks for reading!

Raaz - March 15, 2016, 11:32 pm

No one will be angry, your question is not stupid and is presented in good quality, don't worry. PM me the url, I'll have a look.

Hello Raaz, thanks for willing to help me discover websites hidden CMS versions but do you mind showing me how to detect websites hidden CMS version?

Raaz - March 16, 2016, 4:11 am

The first link you sent in PM (Nigerian) is a blogger cms (blogger.com)
The second link (PM) is not a CMS or could be a custom CMS.

Redshadow - March 16, 2016, 5:31 am

Thanks Raaz, can you detect the custom CMS of the second link I PM you?

Raaz - March 16, 2016, 5:36 am

(Mar 16, 2016 05:31 AM)Redshadow Wrote: [\[CITE\]](#) Thanks Raaz, can you detect the custom CMS of the second link I PM you?

Nope, its fairly secured ?

Redshadow - March 16, 2016, 9:04 am

Thanks for your effort. So the second website is unexploitable?

h?ck?r - March 16, 2016, 9:05 am

No. Just because it's custom doesn't mean there isn't vulns.
