Thread: [config.php](#)

one_nice - March 16, 2016, 1:11 am

Hello,

A quick newb question. Many time using LFI i'm able to get config.php that gives me mysql credential... problem is database hostname which is many time 'localhost'. Is there a good technique to find real database address ?

Thank for all help.

Mr.Fu - March 16, 2016, 2:54 am

check port are open or not with nmap :) mysql port are 3306

JaNuS18 - sorry my mistake, admin please move to the right section,

Mr.Fu - thank you for repl, but scanning the ip of the hostname is the first thing i do ;-)
