Thread: [\[Read\]Suggest me a stresser](#)

Clarity. - March 20, 2016, 2:52 am

If you are a stresser owner/user please take a one min and test weather you can take down this server with your stresser or not. It would help me much.It is a game server.

IP ->

Spoiler ([Click to View](#))

<http://pastebin.com/JABr7AtF>(prevent SEO)

Thanks for spending your time to test it.

Lol, no wonder no one replied, I can severely disrupt their game service for a low price. But as far as just flat out downing it? I can do that but OVH won't nullroute and will take over 100gbps of raw udp and their FR vacuum will go offline as well as a result. It really is just not worth it for me.

Well. If its layer 4 it will need much gbps to make it down but layer 7 might come in handy. not sure it will work or not. XML RPC works on the website of same ip.

So with L7 you break their webserver. But the game server experiences no interference. I have already answered your question above sir.

If you wish to PM me I can set you up with some options of attack.
