Thread: [\[Tutorial\] Edit text on websites with Android/Ios \[/Tutorial\]](#)

Catinashoebox1337 - March 20, 2016, 8:04 pm

Hi! This is my fist, VERY short tutorial for hf, enjoy!

This javascript code can used for social engenering. Changing text in offical websites like amazon or newegg to show different descriptions, model number, pricing and reviews... on your iphone or android.

A. Navagate to the site you want to edit in Chrome.

1. Insert code in chrome browsers http field:

Code javascript:document.body.contentEditable='true'; document.designMode='on'; void 0

2. Chrome will take out javascript: for security reasons so...

3. We need to REENTER 'JavaScript:' at the start for it to work.

4. When done editing the websites text insert code again, but change editable true to false like so:

Code javascript:document.body.contentEditable='false'; document.designMode='on'; void 0

Changing to false makes the webpage function normaly again with edited filds saved.

NOTE: This is only temporary. If you refresh the page it will revert text fields to default. So show it to the person you want before you refresh.

If anyone has more to add or any other mobile tricks, just post below. Thanks and enjoy!

Dang. I actually like this tut!!! Thanks for sharing man!!

Oddissee - March 20, 2016, 8:08 pm

Nice guide mate, thanks for helping the community haha.

Good for faking stuff.
