Is any website "hackable"

I know brute force but in any method

Can the best hackers get into any website they so choose

Like how do they get the databases to big name websites

Whats the best hacking I should learn defiantly not sqli

as very few websites are vulnerable to sql injection

SIM-2502833 - March 22, 2016, 8:48 pm

Depends on the type of hacking you are referring to.

MrAfirmeD - March 22, 2016, 9:07 pm

As @MrMcShroom said.

Every site is hackeable, but not everyone have bugs.

Meaning that if you have the ftp/cpanel user password you could do virtually anything. In the other hand if you don't have user:pass and the site itself doesnt have any bug or vulnerability, then no, you can't "hack it".

Cheers.

It is still possible doing social engineering/phishing. A lot of "big company" as you said got compromised that way.
