Thread: [Yahoo Username Checker | Proxy Support](#)

Ninja - March 27, 2016, 5:51 pm

How to use:

- Place a list of usernames in the executable folder with the name "usernames.txt".
- Optionally place a list of proxies in the executable folder named "proxies.txt" containing HTTP proxies (host:port or host:port:username:password) format. It will rotate through all proxies one by one. When it reaches the last one it goes back to the first one. It changes proxy every 100 checks.
- Run the program.
- Program outputs all valid usernames live to a file called "valid_usernames.txt".

It runs proxyless, so that is a plus I guess.

Thanks bro.

Nah I didn't really have a particular part to look at, just wanted to see his sauce really. Nice work Mr Tyrone Biggums

(Mar 28, 2016 12:00 PM)Oliver Sykes Wrote: [\[CITE\]](#) Why hardcode list names and locations? It doesn't really make much of a difference imho. Most console based apps tend to do that anyway.

Code rivate const string url =

"https://edit.yahoo.com/reg_json?GivenName=&FamilyName=&AccountID={0}@yahoo.com&Pa

noticed one thing..

from my experience fooling with yahoo's webserver in just a few bogus requests from the same address you will get 404d. Quick way around that tho is utilizing every server in their pool l61.member.bf1.yahoo.com finger the servers given at lower end of page source and loop them heavily to extent your results also a few html submission tricks ;) to make it seem like a unique request used to fool the server all the time. Not sure if it will work in present time tho.. however it is still Yahoo! the biggest company being sold that no one wants lol

Not sure if it will work in present time tho.. however it is still Yahoo! the biggest company being sold that no one wants lolWorked fine for me. I tried it and got not a single 404 error nor any other web exception.

Good job OP. I couldn't have done something like this, I'm beginner level.

#Kat - March 30, 2016, 4:58 pm

They might call it non abusive nowadays lol before it was highly abusive

SocialMediaBooster - March 31, 2016, 8:40 am

I guess there is limits , would be nice if you made it proxy compatible because after 100 checks everything becomes valid

Note: i check in bulk (10k usernames) thats why its should be proxy compatible for me to use it other than that nice job

Adding proxy support right now. Give me a few minutes.

Added proxy support for HTTP proxies both with and without authentication.
