Thread: [PHP performance testing](#)

Zaffri - April 1, 2016, 10:13 pm

Hi :)

I am looking to test the performance of a handful of PHP scripts that I plan to write. I was wondering if anyone could point me in the direction of a free to use server-side tool which would provide me with useful stats - like execution time etc. ?

I would prefer to use a tool rather than manually implementing code to time execution. I read that JMeter can measure the performance of PHP scripts, does anyone have experience with it or could suggest a better tool?

Any suggestions are greatly appreciated, thanks!

I think this is what you're looking for: <https://blackfire.io/>

What is it that you're specifically want to test?

Thanks! That's exactly what I am looking for, and it has a free option too! I was basically just looking for a tool that did just this.

Cheers ?
