Thread: [Build your own MVC](#)

newQuery - April 4, 2016, 1:49 pm

What's up HF ?

I have been following this course today just to practice PHP:

[https://www.Udemy](https://www.Udemy.com/learn-object-oriented-php-by-building-a-complete-website) (warez disallowed).com/learn-object-oriented-php-by-building-a-complete-website

I found it very useful.

At the end of the course you should be able to create your own MVC.

I'm pretty sure alot of you already know how-to and won't be going through all the course so I will just share my source code.

I hope you'll like it and will be useful for more than one !

Some screenshots of the final result:

MVC is a design pattern, you'll need some sort of client sided language like JavaScript to make your controller. Luckily, there are awesome frameworks, such as AngularJS out there that enable you to code in the MVC design pattern.

M = Model

V = View

C = Controller

<https://en.wikipedia.org/wiki/Model%E2%80%93view%E2%80%93controller>

If you don't understand the wikipedia article, please hit me up via PM. I'll be glad to explain the approach in detail.

Hello, hm, I never asked for any help, but thanks :)

I know what is a MVC, I followed this course because I wanted to know how-to build one.

I usually use Laravel 5 as framework when I'm working with multiple developers.

So you do need help? :P

Well, if you know what it is and understand what it is, why can't you do it then?

It's as simple as some JS code that retrieves for example JSON from your API and templates it.

I never said that I couldn't do it ?

I don't think you read my thread, because I literally give you the sources and screenshots.

??

Well, shit.

I didn't read your source code because I'm on my Linux box rn and I was too lazy to install something to extract the rar.

My apologies, I saw that you were iterating over your shares, so my idea was that you want to implement the MVC design pattern as follows:

User goes on page,

User makes Ajax request to backend,

User templates ajax response if 20* code

So yeah. RIP me
