Thread: [Is it possible to create your own "private" Dynamic DNS server for RAT](#)

Yotta C0d3MRY User 51 - April 11, 2016, 10:14 am

Hello hf users! I am sorry if posting this in the wrong section but this thread is associated with rat's SO...

As the title say's, is it possible to create my own dynamic dns server and use it with my rat? I have used either no-ip, freedns and others, but I would like to have my own personal (or private) dns so as to be sure that I would not lose my slaves...

I have read some articles and tutorials on the web but I posted this here so as to be sure about this and especially for the reason I want it.

Are there any usefull tutorials here on hf or on the web generally on how to do this (if it is possible)

Thanks for your time :)

Gone4Ever - April 11, 2016, 10:21 am

you can buy a 0.88\$ domain and make a record for you vpnIP/your IP

good luck buddy:)

?DaDooo? - April 11, 2016, 10:22 am

Got to freenom.com and create an account, register a free domain. After this, go to domains, my domains and then click on manage domain. Click Manag freenom dns and add a record. Choose a name and take ttl=360 and target=ip! Now your DNS is name.domain.end :)

EDIT: <https://hackforums.net/showthread.php?tid=4954702&highlight=freenom>

And I can use it with my RAT? I wouldn't have any problems with the connection? Aren't there any softwares needed to install so it could work (like no-ip uses a software) or like freedns, where you need the wget script and GnuWin ?

EDIT: Thanks for the useful link!

If you change your IP, you have to change your Target manuel :)

But I could have a static IP so my IP don't get changed.

If I have a dynamic IP and my IP changes every some days how could I use it?

freedns uses Gnuwin and an .bat wget script.

freedns uses Gnuwin and an .bat wget script.

Freenom has a API: <http://www.freenom.com/en/freenom-api.html>

But I don't know how to use the authentication.

Maybe you can do something with it!

looking to get this knowledge but not from freenom I want to be able to work with my own bulletproof domains and a ddns service I tried 'dynu' but that didn't work and that's making me a bit skeptical about using a paid service 'dyndns'. anybody with any information on how to set up a personal private DNS should please hit me up I'm willing to pay \$10 for the knowledge. yes I'm grave digging but this info is needed urgently and I do not have the time to start a new thread

You could use a free method, pastebin as pointer. Just like LimeRAT. If you want more advanced method then try google.

CyberStrike - December 30, 2018, 1:37 pm

I wouldn't use freenom I have heard of malicious users being shutdown. Your own domain is really the best thing 1 dollar isn't much.

the only reason I'm looking for an advanced method is so that I don't get kicked out of any service I decide to use. is this method your talking about good to use without fear of being kicked out? if not please explain more about this

Why would Pastebin or any similar website kick you out?

Example: <https://pastebin.com/raw/DDTVvwbu> -->> very simple and not malicious.

<https://pastebin.com>

<https://ghostbin.com>

<https://gist.github.com>

...etc
