Thread: [\[Tut\] Access Your Device Anywhere In The World!](#)

DevinThePancake - April 13, 2016, 6:22 am

Hey Guys!

Now if you guys read my [Last Thread](#) about portable hacking using the Raspberry Pi, then you're going to love this. instead of bringing your own hotspot and your whole pi with you, now you can leave your pi at home and just use bring your phone with you!!

How Does This Work?

So you connect your pi to this website called

<https://cayenne.mydevices.com/cayenne/signup>

and so what you do there is sign up and follow all of the sites directions until you get to two ways to install cayenne on your pi

What you want it to install using terminal/command

the way to connect your computer to the pi is first you need [PuTTY](#) and you also need to know your pi's IP address and port which you can easily find out explained on my [Last Thread](#) and put in the first line of command. then copy the second line of command and enter it and you should be done!

I hope you like my short tutorial! if you have any questions or concerns, please comment on the thread.

Enjoy!
