Thread: [Build a simple keylogger, crypt and bind?](#)

UniQ - April 16, 2016, 3:25 pm

Heya guys,

I was wondering if there are any decent, up-to-date and safe to use keyloggers out there? Doesn't necessarily have to be FUD but just pretty solid.

I remember coming to this Forum 4 years ago and getting bombarded by the amount of free keyloggers that developers were handing out like candy lol.

But now its just pay, pay, pay. Nothing wrong with that of course. If a developer spends alot of time on a project then surely he should receive some reward for his hard work. But some of us barely break-even.

I'm currently reading guides on how to build a simple keylogger. They say Python is the easiest to use and it is quite effective. Any down sides to this method? Some of these guides make it look like it only takes literally 5 minutes to create a keylogger. Surely there must be much more to it than that.

Could anyone redirect me to an in-depth, complete beginner keylogger guide?

Does a keylogger work on all Windows platforms? When does it become FUD? is it possible to bind an exe. to an image, video or audio file? If so, will it execute silently? And so on.

I thank you in advance,

~ UniQ

Posting to reference I would like to know as well. Good luck with your search. Providing a bump at the very least.
