Thread: [\[TUT\]Bypassing Kaspersky Endpoint Security 10](#)

AlpiBrine28 - April 18, 2016, 11:38 am

Hello there, Hackforums!

Today I will show you how to bypass Kaspersky Endpoint Security 10 (in case if it's got a password.) Let's begin!

1. Step - Make sure you've got the admin password

In this tutorial, I will presume that you have got the admin password of the PC, but not the password of the anti-virus software. But if you want me to post a thread about cracking the admin password, I will do it!

2. Step - To start things off

Shut the PC down and find the key to boot up the PC in safe mode. Try the F ones - usually F8 and F12.

3. Step - Login into the admin account

Login into the admin account and open the start menu. Type msconfig and hit enter.

4. Step - Disable the services

Go to services and uncheck everything includes Kaspersky. After that, go to startup and uncheck those again.

5. Step - Reboot the PC

You are pretty much done! Just reboot the PC and prepare your RATs ^^

Extra Step

If you are in a situation which you cannot reboot the PC, just use a RAT like jRAT, I don't know why but the antivirus software just doesn't see them. Even if they see it, they don't fully delete it and most of the features of the RAT just keep working.

Thank you for reading guys, hope you like it. Please note that I did not get any of those from any kind of sources.

thanks dude it will be usefull for me?

xHeaven - December 19, 2016, 11:22 am

This isn't "bypassing", you just disabled the Kaspersky.

jgun98.milis - August 24, 2018, 12:18 am

Safe mode will disable the Kaspersky Endpoint but how do I can get password or password recovery?
