Thread: [How create Protect Process](#)

Raymond - April 19, 2016, 11:35 am

Hello. The boys lay anyone. How to create no kill process on C#? To help you not to kill him

Reyden - April 19, 2016, 11:41 am

Easiest way is to create another process. This process restarts your important process if it is not running.

Check another thread in this section "persistence c#" by memesaregreat

Raymond - April 19, 2016, 11:53 am

I'm looking for the source code, but can not find on this please help.

Reyden - April 19, 2016, 12:53 pm

There is a pastebin link with a working (but not well implemented) code snippet

Why not simply learn instead of copy pasting.

1. Create a thread
 2. Check if another process is dead
 3. If process is dead, start it again.
- Do this on both processes, simple?

As said above , here is some simple example of it :
(modify to your needs)

PHP Code

```
<?php
while(true)
{
if(Process.GetProcessesByName("yourExe").Length == 0)
{
Process.Start("yourExe");
}
}
```

}

?
