Thread: [Question; Could you recreate HF's ranking system in Python?](#)

A NEW ERA... - April 25, 2016, 6:00 pm

Such as "has user paid" if yes then l33t if no then 3p1c.. such and such. Want to do it as a little challenge.

Goodies - April 25, 2016, 6:07 pm

Sure. I'm picking up some stuff but this will give me some shit to do when I get home.

yes you can deff do this with no problems. Just need to setup a simple database, have a row for 'user_status', if user_status = 1:
user = admin. Something like that

Are we going the database route? I was just going to do it with objects for the sake of simplicity.

Okay, I lied, I actually had a bit of stuff to do, but I'mma do a little bit now.

Django exists.
Django REST exists.
Web.py exists.
Flask exists.

The answer is yes, you can do a trivial task in Python.
