Thread: [API for ssh roots](#)

? rooq?e ? - April 26, 2016, 8:47 am

Just wondering if anyone knows some good product for ssh roots, to make a DDoS api?

A software to manage all servers and install API on them, so I don't need to do it manually. kinda tedious work, for a huge list of ssh roots

Thanks

You could just infect them with kaiten and use the shell command execution function, that's the simplest way around.

This right here. It's really bad that people still don't know about this.

Can I ask what an SSH Root is? Just distribute and execute some malware binary and use some simple shell command.

Having SSH root means having root access to an SSH server, allowing the person to download, install, and execute scripts & code.

But what if no daemon is running can you still be root? Or is it only an SSH Root when you connect via SSH?
